

LiveLift: your personal deadlift coach

Group 6

CreaTe-VU

Problem Statement:

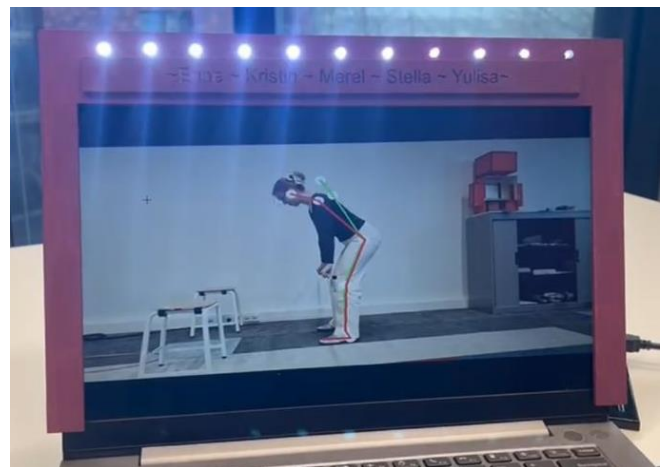

Sports and physical activity are fundamental to a healthy lifestyle. Among young adults, particularly males, gym workouts have gained immense popularity (Upton-Clark, 2024). While the gym provides opportunities to improve fitness, it also poses **risks**. Improper form can strain the body and cause injuries. **Young males aged 18-25 face the highest risk of gym-related injuries**, commonly involving the lower back (Cuthbertson-Moon et al., 2024). The **deadlift** is one of the most popular and effective exercise in the gym but it also causes the most injuries.

Research question: *How can a feedback system prevent injury and improve gym performance for young males, aged between 18-25, that are new to going to the gym and tend to go alone?*

Solution: **LiveLift**

View of the user when they are doing the deadlift correctly

View of the user when they are doing the deadlift wrong

Project Description:

In this project, we built a deadlift correcting system that helps the user to practice their deadlift form in a safe and risk-free way. The system's direct feedback gives the user a chance to correct the movement and posture in real-time. Seeing yourself doing a deadlift from a sideways view makes that you can practice your form individually and offers a more efficient and effective way of learning how to do a deadlift.

LiveLift: We've got your back!
